

## Prepare for tomorrow with today's only end-to-end archiving service solution

### Two industry leaders, one team, infinite solutions

In today's business environment, companies struggle to manage both structured and unstructured data growth. Organizations spend millions of dollars on software, servers, and support systems, in an attempt to control the increasing problem of storage sprawl. Now, imagine a service that securely, efficiently, and affordably manages end-to-end archiving on an enterprise scale, without the need for substantial investment.

Cognizant and Hitachi partnered together to deliver a custom solution, focused on providing a one-stop archiving service offering. Hitachi's Content Platform (HCP) is an object storage solution that enables IT organizations and cloud service providers to store, share, sync, protect, preserve, analyze, retrieve, and safely destroy file data from a single system. Cognizant offers

#### We improve results by:

- Controlling data mobility across storage tiers
- Syncing and sharing data easily around the world
- Reducing backup needs via built-in data protection
- Supporting archiving for compliance and content preservation without structural investments
- Gaining insights from best-in-class metadata architecture

HCP as a fully hosted service on Cognizant's secure servers with additional support, and the option to off-load seldom used data to cloud storage facilities. Together, Hitachi and Cognizant support enterprise expansion of archiving services without compromising efficiency, agility, and security.

**As part of Digital Online Archiving, we offer market-leading archive service solutions:**

- **Document & Content Archiving:** We preserve fully indexed business context, which allows businesses and consumers to easily reuse data throughout the data lifecycle. The solution offers both early and late stage archiving scenarios, which maximizes business results at the lowest possible cost. Each object is managed separately supporting a high level of control.
- **Operational Data Archiving:** Our archive service solutions minimize the risk of transitioning existing structured databases into new archive databases. We offer organizations the ability to optimize the TCO of their business systems, while maintaining high operational availability and data performance.
- **SAP Archiving:** We offer competitive and reliable SAP archiving service solutions; and unlike most enterprises, we provide an alternative archiving program that is compatible with SAP at a fraction of costs.
- **Data Decommissioning:** We support data decommissioning by offering data construct and virtual image archiving. We also offer powerful data analysis to layer with archived data for mining and re-utilization of decommissioned data.

- **E-mail Archiving:** We offer a variety of e-mail archiving solutions: contextualized–sales related mail exchanges, journaling–for specific user groups, and e-mail archiving preservation. Additionally, discovery services are provided to sort and classify emails and attachments before or after archiving.
- **Big Data Archiving:** We support archiving of large, previously analyzed data sets that require storage, because of compliance reasons or for later usage.

**Transforming insurance archiving services:**

- Efficient correspondence archiving, supporting upcoming GDPR and e.g. medical compliance policies. Granular (object level) management of access rights and retention
- Providing all customer dossiers online for both internal and external use. Including legacy policies, and media
- Migration and rationalization of legacy archiving solutions, e.g. in liquidating old pensions funds (APF)
- Fast and cost-effective archiving and record management of operational data from transactional systems
