DRIVE INNOVATION AND AGILITY WITH CLOUD-AGNOSTIC AUTOMATION

ACCELERATE MIGRATION AND BOOST BUSINESS EFFICIENCIES WITH EFFECTIVE CLOUD STRATEGY

The key to maximizing the value of the cloud is to align business objectives with your cloud strategy.

300% Rise in Public Cloud Infrastructure Adoption

AUDIT YOUR CLOUD INFRASTRUCTURE TO FOCUS ON BUSINESS IMPACT

Cloud audits are not a one-and-done proposition. Regular audits of your business needs compared to your IT and cloud assets is essential to finding your hybrid cloud sweet spot.

How are our cloud resources being used to deliver business value?
Which application-support environments, data services, and tools will we need?
In what way will we need to change or modify our applications, so they are able to run in the cloud?
What service level outcomes will complement the needs of the business?
Can some or most of our processes related to the bottom line be automated?

FOCUS ON INNOVATION WITH AGILITY

By using external cloud tools and services to automate the process of building, managing and provisioning, teams are able to accelerate the development process, mitigate human error and establish repeatability.

Create a new integrated DevOps process to modernize, streamline and automate the application life-cycle management process. Remove stovepipes and the serial process of architecting infrastructure and applications.

CLOUD-AGNOSTIC AUTOMATION KEY FOR SUCCESS

A preconfigured solution can offer significant efficiencies to improve multiple, inconsistent DevOps environments with a single, integrated cloud—while leveraging open-source components to help provide agility, ensure quality and code portability.

Combining preconfigured solutions, automation and consistent operations can help to perform time-consuming and repetitive tasks (such as configuration changes, log management and error processing for example). This approach allows experts to focus on more value-added business initiatives.

• Replace multiple, inconsistent DevOps environments with a single, centralized cloud solution
• Leverage open-source components to help eliminate public cloud vendor lock-in (enabling greater flexibility and cost-savings)
• Use preconfigured solutions, automation for repetitive maintenance and management tasks
• Allow IT team members to focus on innovation and value-added business initiatives
